

### 5<sup>th</sup> Grade Mathematics • Unpacked Contents

For the new Standard Course of Study that will be effective in all North Carolina schools in the 2017-18 School Year.

This document is designed to help North Carolina educators teach the 5<sup>th</sup> Grade Mathematics Standard Course of Study. NCDPI staff are continually updating and improving these tools to better serve teachers and districts.

### What is the purpose of this document?

The purpose of this document is to increase student achievement by ensuring educators understand the expectations of the new standards. This document may also be used to facilitate discussion among teachers and curriculum staff and to encourage coherence in the sequence, pacing, and units of study for grade-level curricula. This document, along with on-going professional development, is one of many resources used to understand and teach the NC SCOS.

### What is in the document?

This document includes a detailed clarification of each standard in the grade level along with a *sample* of questions or directions that may be used during the instructional sequence to determine whether students are meeting the learning objective outlined by the standard. These items are included to support classroom instruction and are not intended to reflect summative assessment items. The examples included may not fully address the scope of the standard. The document also includes a table of contents of the standards organized by domain with hyperlinks to assist in navigating the electronic version of this instructional support tool.

### How do I send Feedback?

Link for: Feedback for NC's Math Unpacking Documents We will use your input to refine our unpacking of the standards. Thank You!

### Just want the standards alone?

North Carolina Course of Study – 5<sup>th</sup> Grade Standards

### **Standards for Mathematical Practice**

Pr	actice	Explanation and Example
1.	Make sense of problems and persevere in solving them.	Mathematically proficient students in grade 5 should solve problems by applying their understanding of operations with whole numbers, decimals, and fractions including mixed numbers. They solve problems related to volume and measurement conversions. Students seek the meaning of a problem and look for efficient ways to represent and solve it. They may check their thinking by asking themselves, "What is the most efficient way to solve the problem?", "Does this make sense?", and "Can I solve the problem in a different way?".
2.	Reason abstractly and quantitatively.	Mathematically proficient students in grade 5 should recognize that a number represents a specific quantity. They connect quantities to written symbols and create a logical representation of the problem at hand, considering both the appropriate units involved and the meaning of quantities. They extend this understanding from whole numbers to their work with fractions and decimals. Students write simple expressions that record calculations with numbers and represent or round numbers using place value concepts.
3.	Construct viable arguments and critique the reasoning of others.	In fifth grade mathematical proficient students may construct arguments using concrete referents, such as objects, pictures, and drawings. They explain calculations based upon models and properties of operations and rules that generate patterns. They demonstrate and explain the relationship between volume and multiplication. They refine their mathematical communication skills as they participate in mathematical discussions involving questions like "How did you get that?" and "Why is that true?" They explain their thinking to others and respond to others' thinking.
4.	Model with mathematics.	Mathematically proficient students in grade 5 experiment with representing problem situations in multiple ways including numbers, words (mathematical language), drawing pictures, using objects, making a chart, list, or graph, creating equations, etc. Students need opportunities to connect the different representations and explain the connections. They should be able to use all of these representations as needed. Fifth graders should evaluate their results in the context of the situation and whether the results make sense. They also evaluate the utility of models to determine which models are most useful and efficient to solve problems.
5.	Use appropriate tools strategically.	Mathematically proficient fifth graders consider the available tools (including estimation) when solving a mathematical problem and decide when certain tools might be helpful. For instance, they may use unit cubes to fill a rectangular prism and then use a ruler to measure the dimensions. They use graph paper to accurately create graphs and solve problems or make predictions from real world data.
6.	Attend to precision.	Mathematically proficient students in grade 5 continue to refine their mathematical communication skills by using clear and precise language in their discussions with others and in their own reasoning. Students use appropriate terminology when referring to expressions, fractions, geometric figures, and coordinate grids. They are careful about specifying units of measure and state the meaning of the symbols they choose. For instance, when figuring out the volume of a rectangular prism they record their answers in cubic units.
7.	Look for and make use of structure.	In fifth grade mathematically proficient students look closely to discover a pattern or structure. For instance, students use properties of operations as strategies to add, subtract, multiply and divide with whole numbers, fractions, and decimals. They examine numerical patterns and relate them to a rule or a graphical representation.
8.	Look for and express regularity in repeated reasoning.	Mathematically proficient fifth graders use repeated reasoning to understand algorithms and make generalizations about patterns. Students connect place value and their prior work with operations to understand algorithms to fluently multiply multi-digit numbers and perform all operations with decimals to hundredths. Students explore operations with fractions with visual models and begin to formulate generalizations.

### **Operations and Algebraic Thinking**

### Write and interpret numerical expressions.

NC.5.OA.2 Write, explain, and evaluate numerical expressions involving the four operations to solve up to two-step problems. Include expressions involving:

- Parentheses, using the order of operations.
- Commutative, associative and distributive properties.

Write and interpret numerical expressions.

NC.5.OA.2 Write, explain, and evaluate numerical expressions involving the four operations to solve up to two-step problems. Include expressions involving:
 Parentheses, using the order of operations.
 Commutative, associative and distributive properties.

Clarification	Checking for Understanding
	Sandy walked $\frac{3}{4}$ mile on Monday and $\frac{3}{4}$ mile on Tuesday. On Wednesday, she walked 3 times as much as Monday and Tuesday combined. Write an expression to show how many
	miles Sandy walked on Wednesday.
	Possible response: $3 \cdot \left(\frac{3}{4} + \frac{3}{4}\right)$
	Serenity has $\frac{1}{4}$ of a pound of turkey and $\frac{1}{8}$ of a pound of ham on each sandwich. She has
	4 sandwiches. Serenity can't decide which expression matches her situation:
	Explain which expression matches her situation and why.
	$4x_{\frac{1}{4}} + \frac{1}{8} OR 4x(\frac{1}{4} + \frac{1}{8})$
	Possible response:
	has turkey and ham, so I have 4 groups with $\frac{1}{4} + \frac{1}{8}$ in each group.
	Nico solves both expressions.
	A: 1.5 x 0.16 - 0.09
	B: 1.5 x (0.16 - 0.09)
	Which expression is greater? What is the difference in the value between the two expressions?
	Possible response:
	Expression A has a value of 0. 15. Expression B has a value of 0. 105. Expression A is greater. The difference between the expressions is 0.045.

Return to Standards

### Analyze patterns and relationships.

NC.5.OA.3 Generate two numerical patterns using two given rules.
Identify apparent relationships between corresponding terms.

- Form ordered pairs consisting of corresponding terms from the two patterns. Graph the ordered pairs on a coordinate plane. •

Clarification	Checking for Understanding
This standard extends the work from Fourth Grade, where students generate numerical patterns when they are given one rule. In Fifth Grade, students are given two rules and generate the terms in the resulting sequences. Students are also expected to interpret a real-world context with two patterns, create a table and analyze the relationships between those terms. In terms of graphing, after determining the resulting sequences of patterns, students are expected to identify, record, and graph ordered pairs on a coordinate plane (first guadrant only). After graphing the ordered pairs for each rule.	Sam catches 2 fish each day. Terri catches 4 fish each day. They fish for 5 days.DaysSam's Total NumberTerri's Total Numbera) Make a table to show how many fish they have individually caught after each of the 5 days.DaysSam's Total NumberTerri's Totalb) Plot ordered pairs for each data point in the table. The days should be the x-coordinate. Make a line graph out of the ordered pairs for each person, and interpret the graph.000001242483612481651020
quadrant only). After graphing the ordered pairs for each rule, students can analyze the relationship between the results. This work intersects the expectations in NC.5.G.1.	Possible response: Terri's fish increases at a higher rate since she catches 4 fish everyday. At the end of day 4 the number of fish that Sam has caught is half of the number of fish that Terri has caught. At the end of day 3 the number of fish that Sam has caught is 6 less than the number of fish that Terri has caught.
	Mary spends \$20 a month buying magazines. Tammy spends \$15 a month buying magazines.         Mary spends \$60 in 3 months. How long does it take Tammy to spend \$60? Make a table to show the amount each woman spends on magazines. Plot the points on a coordinate plane and interpret the graph.         Possible response:         Mary         Month       Amount         1       20         2       40         3       60

### Analyze patterns and relationships.

NC.5.OA.3 Generate two numerical patterns using two given rules.
Identify apparent relationships between corresponding terms.

- Form ordered pairs consisting of corresponding terms from the two patterns. Graph the ordered pairs on a coordinate plane. •

Clarification	Checking for Understanding
	<ul> <li>Crecking for Understanding</li> <li>Cora and Cecilia each use chalk to make their own number patterns on the sidewalk. They make each of their patterns 10 boxes long and line their patterns up so they are next to each other. Cora puts 0 in her first box and decides that she will add 3 every time to get the next number. Cecilia puts 0 in her first box and decides that she will add 9 every time to get the next number.</li> <li>a. Complete each girl's sidewalk pattern.</li> <li>b. How many times greater is Cecilia's number in the 5th box? What about the numbers in the 8th box? The 10th box?</li> <li>c. What pattern do you notice in your answers for part b? Why do you think that pattern exists?</li> <li>d. Write your data as ordered pairs and graph the points on a coordinate plane.</li> <li>e. What pattern do you notice about your graph? Why do you think that pattern exists?</li> <li>Possible Responses: <ul> <li>a. 0, 3, 6, 9, 12, 15, 18, 21, 24, 27, 30</li> <li>0, 9, 18, 27, 36, 45, 54, 63, 72, 81, 90</li> </ul> </li> <li>b. Cecilia's number in the 5th box is 36. Cora's number is 12. Since 12 x 3 = 36, Cecilia's number is 31 imes greater than Cora's number. For the 8th box Cora's number is 24 and Cecilia's number is 72. Cecilia's number is still 3 times greater. For the 10th number Cora's number is 30 and Cecilia's number is 90. Cecilia's number is still three times greater than Cora's number.</li> <li>c. Cecilia's number is always three times greater than Cora's number.</li> <li>c. Cecilia's number is always three times greater than Cora's number.</li> <li>d. Cora- (1,3); (2,6); (3, 9); (4, 12); (5, 15); (6, 18); (7, 21); (8, 24); (9, 27), (10, 30) Cecilia- (1, 9); (2, 18); (3, 27); (4, 36); (5, 45); (6, 54); (7, 63); (8, 72); (9, 81); (10, 90)</li> </ul>

NC.5.OA.3 Generate two numerical patterns using two given rules.

- Identify apparent relationships between corresponding terms.
- Form ordered pairs consisting of corresponding terms from the two patterns. •
- Graph the ordered pairs on a coordinate plane. •

### Analyze patterns and relationships.

NC.5.OA.3 Generate two numerical patterns using two given rules.

- Identify apparent relationships between corresponding terms.
- Form ordered pairs consisting of corresponding terms from the two patterns.
- Graph the ordered pairs on a coordinate plane.
   Clarification

### Checking for Understanding

Marcello and Johan are both walking on the track. Marcello is 15 feet ahead of Johan. Marcello walks 5 feet per second and Johan walks 7 feet per second.

Complete a table that shows their distance for the first 10 seconds that they walk.

Will Johan ever be in front of Marcello? If so, how long will it take for Johan to get ahead of Marcello?

### Possible response:

Time	Marcello	Johan	Distance	
0	15	0	15	
1	20	7	13	
2	25	14	11	
3	30	21	9	
4	35	28	7	
5	40	35	5	
6	45	42	3	
7	50	49	1	
8	55	56	1	
	60	63	3	

Return to Standards

Number and Operations in Base Ten				
<ul> <li>Understand the place value system.</li> <li>NC.5.NBT.1 Explain the patterns in the place value system from one million to the thousandths place.</li> <li>Explain that in a multi-digit number, a digit in one place represents 10 times as much as it represents in the place to its right and 1/10 of what it</li> </ul>				
<ul><li>represents in the place to its left.</li><li>Explain patterns in products and quotients when numbers are multiplatered and place to its left.</li></ul>	plied by 1,000, 100, 10, 0.1, and 0.01 and/or divided by 10 and 100.			
Clarification	Checking for Understanding			
In this standard, students extend their understanding of the base-ten system and the magnitude of digits in a number to the relationship between adjacent places. This standard also extends student understanding of the relationships of digits in whole numbers to the relationship of decimal fractions. Students should work with the idea that the tens place is ten times as much as the ones place, and the ones place is $\frac{1}{10}$ the size of the tens place.	<ul> <li>Juanita and Aniyah were playing a game where they drew digits and placed them on a game board. Juanita built the number 426.7. Aniyah built the number 746.2.</li> <li>How much smaller is the 4 in Aniyah's number than the 4 in Juanita's number?</li> <li>How much bigger is the 7 in Aniyah's number than the 7 in Juanita number?</li> </ul>			
For example: In the number 55.55, each digit is 5, but the value of the digits is different because of the placement. The 5 that the arrow points to is 1/10 of the 5 to the left and 10 times the 5 to the right. The 5 in the ones place is 1/10 of 50 and 10 times five tenths. $555555$ $\frac{5}{1}5555$ $\frac{5}{5}5555}$	<ul> <li>Write a sentence explaining how the size of the 2 in Aniyah's number compares to the size of the 2 in Juanita's number.</li> <li>Possible Response: The 4 in Aniyah's number is in the tens place so it has a value of 40. The 4 in Juanita's number is in the hundreds place so it has a value of 100. Since the tens place is 1 place to the right of the hundreds places the value of the 4 in Aniyah's number is one-tenth the value of the 4 in Juanita's number.</li> </ul>			
x10 x10 x10 x10 Students are also expected to apply the relationship between adjacent digits when looking at the relationship between digits that are non-adjacent.	<ul> <li>you just always add 0 to the end of the number. Think about her statement (conjecture), then answer the following questions.</li> <li>For both numbers, does Veronica's statement (conjecture) work?</li> </ul>			
For example: In the number 4.054, what is the difference in the magnitudes of the 4s?	<ul> <li>When doesn't veronica's statement (conjecture) work? Is it also true for division? When you divide a number by 10, can you just remove a 0 from the end of the number? Try it with 5.289 and 52,890.</li> <li>When does that work? When doesn't that work?</li> </ul>			
The 4 in the ones place is three places to the left of the 4 in the thousandths place. Therefore, the difference in the value of the digits is 10 times greater for each of the three places, which the magnitude of the 4 in the ones place $10 \times 10 \times 10$ or 1,000 times greater.	Maria's teacher gives Maria a set of place value blocks and tells her that the rod now has a value of 0.01. Her teacher asks her to find the value of: a small cube?			
In this standard, digits may be compared to digits up to 3 places to the left $(x1,000)$ or 2 places to the right (+100 or x 0.01)	a large cube? Explain your reasoning.			

### Understand the place value system.

NC.5.NBT.1 Explain the patterns in the place value system from one million to the thousandths place.

- Explain that in a multi-digit number, a digit in one place represents 10 times as much as it represents in the place to its right and  $\frac{1}{10}$  of what it represents in the place to its left.
- Explain patterns in products and quotients when numbers are multiplied by 1,000, 100, 10, 0.1, and 0.01 and/or divided by 10 and 100.

Clarification	Checking for Understanding
	Possible response:
	The small cube is $\frac{1}{10}$ the size of rod so it has a value of 0.01 x 0.1 so 1
	cube has a value of 0.001. The flat square is 10 times larger than the rod so it has a value of 0.01 x 10 so 1 flat square has a value of 0.1 The cube is 10 times larger than the flat square which is 10 x 10 larger than the rod. So, the cube has a value of 10 x 10 x 0.01 which is 1.

Return to Standards

### Understand the place value system.

- NC.5.NBT.3 Read, write, and compare decimals to thousandths.
  Write decimals using base-ten numerals, number names, and expanded form.
  - Compare two decimals to thousandths based on the value of the digits in each place, using >, =, and < symbols to record the results of • comparisons.

	Clarification	Checking for Un	derstanding		
	In this standard, students build on their previous understandings of reading and writing whole numbers in various forms to reading, writing, and comparing decimals to the thousandths place.	Mike's teacher asked him to write 987.654 using expanded notation. Mike wrote 900 + 8 7 + 0.6 + 0.50 + 0.400		tation. Mike wrote 900 + 80 +	
Written form or number name refers to writing out a number in words like "two thousand, eight hundred fifty-six." Traditional expanded form is 2,856 = 2,000 + 800 + 50 + 6. However, students should explore the idea that 2,856 could also be 28 hundreds + 5 tens + 6 ones or 1 thousand + 18 hundreds + 56		understand expanded notation?			
		The table below s 2012 Olympics.	shows the results of the	e Men's 100 Meter Fre	estyle Final at the London
	ones. They should also show understanding by expanding a		Country	Time (in seconds)	1
	number by place value such as $(2 \times 1,000) + (8 \times 100) + (5 \times 10) +$		Australia	47.5	
	(6 X 1).		Brazil	47.92	
	Students read decimals using fractional language and write		Canada	47.8	
	decimals in fractional form, as well as in expanded notation. The		Cuba	48.04	
	number 361.248 would be read three hundred sixty-one and two		France	47.48	
	hundred forty-eight thousandths. In expanded form this number		Netherlands	47.88	
	would be written 300 + 60 + 1 + 0.2 + 0.04 + 0.008.		Russia	48.44	
	lust as with whole numbers, students should be comfortable with		United States	47.52	j
various forms of numbers and with expanding numbers by place value in expanded notation, such as $(3 \times 100) + (6 \times 10) + (1 \times 1) +$ $(2 \times 0.1) + (4 \times 0.01) + (8 \times 0.001)$ . Students are expected to use decimal as well as fraction notation for tenths, hundredths, and thousandths.	Put the countries in order from first to last place.				
	Using the times above, write 3 expressions comparing the various times. Use symbols for greater than or less than in your expressions. Write a sentence to go with each expression.				
Also, in this standard, students use their understanding of the value of digits to compare two numbers by examining the value of each digit. Building on their understanding of comparing whole		Mackenzie said that Russia won the gold medal. Is she correct? Why or why not? Vikas said that Australia won the gold medal. Is she correct? Why or why not?			
	numbers, students would compare tenths to tenths, hundredths to hundredths, and thousandths to thousandths.	Possible responses: McKenzie's misconception is that the greatest number means the fastest time. However, in the case of a race the smallest number means the fastest time.			
Students are expected to be able to compare numbers presented in various forms. This standard focuses on comparing numbers and using reasoning about place value to support the use of the symbols <, >, =.		Vikas' misconception is that 47.5 is smaller than 47.48. Since the tens and ones place are the same, looking at the tenths place indicates that 47.48 is smaller than 47.5. France won the gold medal.			

Understand the place value system.

NC.5.NBT.3 Read, write, and compare decimals to thousandths.

- Write decimals using base-ten numerals, number names, and expanded form.
- Compare two decimals to thousandths based on the value of the digits in each place, using >, =, and < symbols to record the results of comparisons.

Clarification	Checking for Understanding
	Cassandra measured the weight of her full backpack in kilograms. Her backpack weighed 5.622 kilograms. Her friends Henry, Stella, Giovanni, and Charlotte weighed their backpacks. Henry's backpack was 5.631 kilograms. Stella's backpack was 5.289 kilograms. Giovanni's backpack was 5.607 kilograms. Charlotte's backpack was 5.7 kilograms. Tell which backpacks were heavier and which backpacks were lighter than Cassandra's. Use numbers and symbols to show each comparison.
	Responses: Heavier: Charlotte (5.7), Henry (5.631) Lighter: Stella (5.621), Giovanni (5.607)

Perform operations with multi-digit whole numbers.				
Clarification	Checking for Understanding			
In this standard, students connect the foundational, conceptual work for multiplication from third and fourth grade to an efficient algorithm, including but not limited to the US standard algorithm. In third grade, students explore the meaning of whole number multiplication. In fourth grade, students built that understanding by multiplying three-digit factors times a one-digit factor and multiplying two two-digit factors. To develop understanding of multiplication, students used a variety of strategies, including area models, partial products, and the properties of operations. The area model helps students visualize the components of the product and connect partial products to an efficient algorithm.	One of the of t			
The U.S. standard algorithm is the end of a progression of other strategies and students should not be forced into the algorithm (or any specific algorithm) without extensive opportunities to work with the other strategies. "In mathematics, an algorithm is defined by its steps and not by the way those steps are recorded in writing. With this in mind, minor variations in methods of recording standard algorithms are acceptable." (Fuson & Beckmann, 2013). Array model 40 - 6 40 - 6	$5 \times 12 = 60.  60 \times 5 =$ $300$ $I \text{ then added } 2,400 \text{ and}$ $300$ $2,400 + 300 = 2,700.$ Draw an array model for 225 x 12. Explain how this model connects to the standard algorithm. Possible responses: $200  20  50$ $400$ $2,000  200  50$ $400$ $50$ $40$ $50$ $400$ $50$ $40$ $50$ $40$ $50$ $400$ $50$ $40$ $50$ $50$ $40$ $50$ $50$ $40$ $50$ $50$ $50$ $50$ $50$ $50$ $50$ $5$			
Students are fluent when they display accuracy, efficiency, and flexibility. Students develop fluency by understanding and internalizing the relationshi that exist between and among numbers. By studying patterns and number relationships, students can internalize strategies for efficiently solving problems.	ps $\begin{vmatrix} 2 & 2 & 5 \\ x & 1 & 2 \\ 4 & 5 & 0 \\ \frac{+2 & 2 & 5 & 0}{2 & 7 & 0 & 0} \end{vmatrix}$ in the U.S. standard algorithm I see 450 which is the sum of the 3 numbers in the bottom row of the array model (400 + 40 + 10 = 450). I see 2,250 which is the sum of the 3 numbers in the top row of the array model (2,000 + 200 + 50 = 2,250).			

### Perform operations with multi-digit whole numbers.

**NC.5.NBT.6** Find quotients with remainders when dividing whole numbers with up to four-digit dividends and two-digit divisors using rectangular arrays, area models, repeated subtraction, partial quotients, and/or the relationship between multiplication and division. Use models to make connections and develop the algorithm.

24 2 17 17 subtracting 0 ones.	I want to get to 1,/16 We have an area of 1,/16. I know that				
$\begin{bmatrix} 10 \\ 24 \times 10 = 240 \\ -240 $	I know that 100 16's equals one side of my array is 16 units long. I				
$\begin{array}{c c c c c c c c c c c c c c c c c c c $	1,600 Used 16 as the neight. I am trying to				
$5 \frac{24 \times 5= 120}{48} - \frac{120}{48} (5 \times 24) \frac{-240}{168} (10 \times 24) \frac{-168}{-168} (7 \text{ ones } \times 24 = 168 \text{ ones})$	$1 600 \pm 90 = 1.690$				
$\begin{array}{c ccccccccccccccccccccccccccccccccccc$	Two more groups of 16's the height is 16, $100 \pm 7 \pm 107 \text{ P} A$				
10+5+2=17 rows 0 0 48	equals 32 which gets us to				
$\begin{pmatrix} -40\\ 0 \end{pmatrix}$ (2 × 24)	1 712 100 7				
If Mr. Campbell makes 10 rows with 24, he will put down 240 chairs because 24 chairs x 10 rows = 240 chairs. That leaves 168 chairs because	1 am 4 away from 1.716				
408 total chairs - 240 = 168 chairs. That's not enough to make another 10 rows, but half of 240 is 120, so Mr. Campbell can make 5 rows. 24 chairs x 5 rows = 120 chairs. 168 chairs - 120 = 48 chairs left. I know that if Mr. Campbell makes 2 rows of 24 chairs, that will be 48 chairs	So we had $100 + 5 + 2 = 107$ 16 100 x 16 = 1,600 7 x 16				
because 2 x 24 = 48. So, 10 rows + 5 rows + 2 rows = 17 rows of chairs that Mr. Campbell will set up.	teams.				
Note that students should be able to use this explanation to describe any of the strategies above, except that the blue and green are combined into one step for the standard algorithm.	Those other 4 students can 1,716 - 1,600 = 116 - 112 =				
	just hang out. 116 4

<ul> <li>When adding 3.6 + 1.7, a student might estimate the sum to be larger than 5 because 3.6 is more than 3 ½ and 1.7 is more than 1 ½.</li> </ul>	Cm long. How long is Stephanie's worm?         Possible student responses:         Subtracting in parts	Decomposing both numbers by place
<ul> <li>When subtracting 5.4 – 0.8, student might estimate the answer to be a little more than 4.4 because a number less than 1 is being subtracted.</li> <li>When multiplying 6 x 2.4, a student might estimate an answer between 12 and 18 since 6 x 2 is 12 and 6 x 3 is 18. Another student might give an estimate of a little less than 15 because s/he figures the answer to be very close, but smaller than 6 x 2 1/2 and thinks of 2 1/2 droups of 6 as 12 (2 groups of 6) ± 3 (1/2)</li> </ul>	26.04 - 8.79 =       26         I decomposed 8.79 into 8, 0.7, and 0.09.       26         26.04 - 8 = 18.04       18.04 - 0.7 = 17.34         17.34 - 0.09 = 17.25	$5.04 - 8.79 = \{15}  0.9$ $10  16  4  0.14$ $20 + 6 + 0.0 + 0.04$ $\{-8}  -0.7  -0.09$ $10 + 7  + 0.2 + 0.05 = 17.25$
of a group of 6).	Addition and Subtraction At the North Carolina Zoo there is a bucket that grizzly bears. The gorilla food weighs 5.384 kg. than the grizzly bear food. How much food for be bucket? Possible Responses:	contains food for the gorillas and the The gorilla food weighs 0.796 kg more oth gorillas and grizzly bears are in the
	Gorilla food = 5.384 kg Grizzly food = 5.384 - 0.796, which is also 0.79 + = 5.384 I am going to add up from 0.796 until I reach 5.384. 0.796 + 0.004 = 0.80 0.80 + 0.20 = 1 1+4 = 5 5 + 0.384 = 5.384 Answer = 0.004 + 0.2 + 4 + 0.384 = 4.588 kg Total = 5.384 + 4.588	<ul> <li>I am going to start with 5.384 and add the 4.588 one place at a time.</li> <li>5.384 + 4 + 0.5 + 0.08 + 0.008</li> <li>5.384 + 4 = 9.384</li> <li>9.384 + 0.5 = 9.884</li> <li>9.884 + 0.08 = 9.964</li> <li>9.964 + 0.008 = 9.972 kg</li> </ul>

- Add and subtract decimals to thousandths using models, drawings or strategies based on place value.
- Multiply decimals with a product to thousandths using models, drawings, or strategies based on place value.
- Divide a whole number by a decimal and divide a decimal by a whole number, using repeated subtraction or area models. Decimals should be limited to hundredths.
- Use estimation strategies to assess reasonableness of answers.

Clarification	Checking for Understanding	
	Multiplication You live 14 hundredths of a mile from your friends' house. After walking 3 tenths of the distance, you stop to talk to another friend. How much of a mile have you walked? (0.3 x .14)	
	Possible responses: <u>Using the Area Model</u>	
	0.1 0.04 0.03 + 0.012	
	$0.3  0.3 \times 0.1 = 0.03 \qquad 0.3 \times 0.04 = 0.012 \qquad 0.042$	
	Using Reasoning about the Decimal Point 0.3 x 0.14 = 3 x 14 = 42 Since we multiplied 0.3 by a number that is close to 0.1 the answer will be close to 0.03. Therefore, it makes sense that the answer is 0.042.	
	Multiplication A gumball costs \$0.22. How much do 12 gumballs cost? Estimate the total, and then calculate. Was your estimate close?	
	Possible response: I estimate that the answer	
	will be close to the product of 0.20 x 10 which is 2. I used decimal grids and shaded in 12 groups that are 0.22 each. I counted 24 tenths which	
	nas a value of 2.4 and 24 hundredths which has a value of 0.24. That makes a combined value of 2.64 so 0.22 x 12 = 2.64.	

- Add and subtract decimals to thousandths using models, drawings or strategies based on place value.
- Multiply decimals with a product to thousandths using models, drawings, or strategies based on place value.
- Divide a whole number by a decimal and divide a decimal by a whole number, using repeated subtraction or area models. Decimals should be limited to hundredths.
- Use estimation strategies to assess reasonableness of answers.

Clarification	Checking for Understanding	
	Multiplication and Subtraction         Trinity buys containers of water for a science project. Each container holds 2.75 Liters.         After using some containers for a science project, she has 3.5 containers left. If Trinity started with 12 containers how much water has she used?         Possible responses:         If Trinity started with 12 containers and has 3.5 left, we can find how many containers she used by subtracting 3.5 from 12. 12 - 3.5 = 8.5	
	Each container holds 2.75 Liters so the amount of water she used is 2.75 x 8.5Area ModelPartial Quotients2 $8 \times 2 = 2 \times 0.5$ 1616 5.6 162.75 2.75 2.550.7 $8 \times 0.7$ $= 5.6$ $0.5 = 0.35$ $0.35$ 16 5.6 1 0.4 $0.35$ $\pm 0.025$ Partial Quotients0.0 $8 \times 0.7$ $0.35$ $\pm 0.05 = 0.05 = 0.05 = 0.40$ 0.4 $0.025$ $2.75 \times 8.5$ $2.75 \times 8.5$ 0.0 $8 \times 0.7 \times 0.7 \times 0.7 \times 0.7 \times 0.35$ $\pm 0.025$ $23.375$ 100 $0.4 \times 0.0$ $-16 \times 0.00$ $2 \times 3.375$ $2.75 \times 0.5 \times 0.5 \times 0.5 \times 0.05 \times 0.05 \times 0.05 \times 0.025$ 0.0 $8 \times 0.5 \times 0.05 \times 0.025$ 0.05 = 0.05 \times 0.025Ny estimate is that my product is close to the product of 3 times 9 so my answer is close to 27. So the decimal goes after the first 3 so my answer is 23.375.

- Use estimation strategies to assess reasonableness of answers.

Clarification	Checking for Understanding
Clarification Division of Whole Number by a Decimal Division involves dividing the total by either the group size or the number of groups. When dividing a whole number by a decimal the most natural context for students is to divide a total amount by the group size. Students make more sense of the concept of division when they explore and solve real-world contexts (van de Walle et al., 2019).	Checking for Understanding         Division of Whole Number by a Decimal         Sarah makes 2 pounds of trail mix. How many bags will she need if she puts 0.25 pounds of mix in each bag?         Possible response:         The equation for this context is 2 ÷ 0.25 =         I showed the two pounds of mix using decimal squares. Then, I colored in 25 squares to represent 25 hundredths. I continued to do that until all of the squares had been colored. Since 2 pounds ÷ 0.25 pound = 8 bags, Sarah will need 8 bags for her trail mix.         Division and Subtraction       A pack of water contains 4 bottles of water. The pack regularly costs \$15.06 but is on sale. The sales price is \$2.58 lower than the regular price. What is the price per bottle of the sales price?
	Division and Subtraction A pack of water contains 4 bottles of water. The pack regularly costs \$15.06 but is on sale. The sales price is \$2.58 lower than the regular price. What is the price per bottle of the sales price? Possible Response: Subtracting and then Using an Area Model to Divide $ \begin{array}{r} 4 \\ 515.06 - $2.58 = $12.48 \\ $12.48  div  by  4 \\ 12 + 0.4 + 0.08 = 12.48 \\ 0.02 \times 4 = 0.08 \\ \end{array} $ My quotient is 3 + 0.1 + 0.02 = 3.12

### Use equivalent fractions as a strategy to add and subtract fractions.

NC.5.NF.1 Add and subtract fractions, including mixed numbers, with unlike denominators using related fractions: halves, fourths and eighths; thirds, sixths, and twelfths; fifths, tenths, and hundredths.

# Apply and extend previous understandings of multiplication and division to multiply and divide fractions. NC.5.NF.3 Use fractions to model and solve division problems.

- Interpret a fraction as an equal sharing context, where a quantity is divided into equal parts.
- Model and interpret a fraction as the division of the numerator by the denominator.
- Solve one-step word problems involving division of whole numbers leading to answers in the form of fractions and mixed numbers, with denominators of 2, 3, 4, 5, 6, 8, 10, and 12, using area, length, and set models or equations.

Clarification	Checking for Understanding
While working on NC.5.NE.3, students are expected to associate fractions	If 4 people want to share a 9-foot piece of ribbon equally, how many feet of ribbon
with division understanding that $5 \div 3$ can be written and expressed as $\frac{5}{3}$	should each person get?
In this standard, students make explicit connections between a fraction and an equal sharing (division) context. Students are expected to be able to represent these real-world contexts using area, length, and set models with the denominators specified in the standard.	Possible responses (also see strategies in the Clarification): Student A: Each person is a group, so I partitioned each foot into fourths. I then counted. A B C D A B C D A B C D
Answers/ Quotients to these division contexts can be in the form of fractions less than 1, whole numbers, or mixed numbers. Students are expected to apply their understanding of equivalent fractions (NC.3.NF.3, NC.4.NF.1) while working with this standard.	A     B     C     D     A     B     C     D       A     B     C     D     A     B     C     D
Strategies for solving equal sharing tasks (Empson & Levi, 2011):	Based on my picture each person will get 9 sections and each section is $\frac{1}{4}$ , so each person will get $\frac{9}{4}$ which can be renamed as $2\frac{1}{4}$ .
Four bags of crackers are being shared between myself and 5 friends.	Student B
Non- anticipatory sharingChild does not anticipate or estimate how much each person will get. Here they decided to give everyone a half. They may or may not share the final bag.	I am trying to figure out how many 4s are in 9. I skip counted by 4s up to 9. 4, 8. That is 2 groups of 4 and I have 1 leftover since 8 is 1 away from 9. This means each person will get 2 feet of ribbon. 8 is 1 away from 9 so there is 1 left that needs to be partitioned between the 4 people.
Additive       Child shows each bag and shares each bag by the number of people. In this case each bag will be split into sixths.         Image: Sharing one item at a time       Image: Child shows each bag and shares each bag will be split into sixths.	Student C: I am splitting 8 feet of ribbon into 4 groups. Each person will get 2 whole feet of ribbon. I have 1 foot of ribbon left that I will share between 4 people. $A  B  C  D$ Each person will get $\frac{1}{4}$ of a whole as well as their original 2 feet. Each person will 2 $\frac{1}{4}$ feet of a ribbon.

NC.5.NF.3 Use fractions to model and solve division problems.

- Interpret a fraction as an equal sharing context, where a quantity is divided into equal parts.
- Model and interpret a fraction as the division of the numerator by the denominator.
- Solve one-step word problems involving division of whole numbers leading to answers in the form of fractions and mixed numbers, with denominators of 2, 3, 4, 5, 6, 8, 10, and 12, using area, length, and set models or equations.

Clarification	Checking for Understanding
Additive CoordinationStudent represents each bag. They see that 2 bags split into thirds gets 6 pieces. Therefore each person will get 2	There are 7 packages of crackers on the counter. If Nina divides them equally between herself and 3 friends, how many packages does each person get?
Sharing groups of itemspieces and each piece is $\frac{1}{3}$ so each student receives $\frac{2}{3}$ of a bag.A B CD E FA B CD E F	Possible responses: Student A: There are 7 packages that are being equally shared among 4 people. I can write that as 7 divided by 4. a       b       c       d       a       b       c       d
Ratio Student may or may not draw the whole model. They use knowledge from repeated halving to look at smaller numbers. In our example they may know that 4 things shared between 6 people is equivalent to 2 things being shared between 3 people. They then realize that each person will get $\frac{2}{3}$ of a bag of chips.	abcdabcdEach person gets 7 fourths, which can be represented as 7 x $\frac{1}{4} = \frac{7}{4}$ .Student B: First, I gave each person 1 whole package.ABCD
Multiplicative Coordination Student does not need to draw a model. They can independently explain that the numerator is the number of things being shared and the denominator is the number of people or groups that the things are being divided into (e.g., 4 bags shared between 6 people means each person will receive 46 of a bag.	With the 3 remaining packages, I gave each person $\frac{1}{2}$ of a package. With the last package, each person received $\frac{1}{4}$ . Each person got $1 + \frac{1}{2} + \frac{1}{4}$ or $1 \frac{3}{4}$ packages.AABCCDABCDStudent C: I am sharing 7 packs between 4 people. Each person will get $\frac{7}{4}$ , which can get renamed as $1 \frac{3}{4}$ .

Return to <u>Standards</u>

NC.5.NF.4 Apply and extend previous understandings of multiplication to multiply a fraction or whole number by a fraction, including mixed numbers.

- Use area and length models to multiply two fractions, with the denominators 2, 3, 4.
- Explain why multiplying a given number by a fraction greater than 1 results in a product greater than the given number and when multiplying a given number by a fraction less than 1 results in a product smaller than the given number.

Solve one-step word problems involving multiplication of fractions using models to develop the algorithm.

**Clarification** This standard extends students' work with multiplication from earlier grades. In fourth grade, students worked with multiplying fractions less than one by whole numbers. The beginning of their exploration with fraction multiplication included recognizing that a fraction such as  $\frac{3}{4}$  can be represented as 3 pieces that are each one-fourth (3 x  $\frac{1}{4}$ ).

This standard references both the multiplication of a fraction by a whole number and the multiplication of two fractions, including mixed numbers. Multiplication of a fraction by a whole number is open to denominators 2, 3, 4,

5, 6, 8, 10, and 12 because this skill was introduced in fourth grade.

Multiplication of a fraction by a fraction is limited to ONLY the denominators 2, 3, and 4. This standard includes situations where students must multiply two mixed numbers together.

Students are expected to create and use visual fraction models (area models, tape diagrams, number lines) during their work with this standard. The language in the standard "develop the algorithm" means that models should always be used and the algorithm is limited to only exposure at the same time as models in Grade 5.

Checking for UnderstandingUse area and length models to multiply two fractions, with the denominators 2,3, and 4.

### **Multiplying Two Mixed Numbers**

There are  $3\frac{1}{4}$  packages of pencils on the desk. One full package weighs  $1\frac{1}{2}$  pounds. How much do all of the containers weigh?

Possible response:

Decomposing a Factor and Using Models

The equation that matches the situation is  $3\frac{1}{4} \times 1\frac{1}{2}$ . I am going to decompose the  $3\frac{1}{4}$  into 3 and  $\frac{1}{4}$ .

 $3\frac{1}{4} \times 1\frac{1}{2} = (3 \times 1\frac{1}{2}) + (\frac{1}{4} + 1\frac{1}{2}).$ *I know 3 packages = 1* $\frac{1}{2}$  + 1 $\frac{1}{2}$  + 1 $\frac{1}{2}$  = 4 $\frac{1}{2}$  pounds.

For the last package in the picture, I need to find  $\frac{1}{4}$  of  $1\frac{1}{2}$ .

Based on the picture  $\frac{1}{4}$  of  $1\frac{1}{2}$  shows 3 parts shaded and there are 8 parts in the whole. So,  $\frac{1}{4}$  of  $1\frac{1}{2}$  is  $\frac{3}{8}$ . The answer is  $4\frac{1}{2} + \frac{3}{8} = 4\frac{7}{8}$ .

- Use area and length models to multiply two fractions, with the denominators 2, 3, 4.
- Explain why multiplying a given number by a fraction greater than 1 results in a product greater than the given number and when multiplying a given number by a fraction less than 1 results in a product smaller than the given number.
- Solve one-step word problems involving multiplication of fractions using models to develop the algorithm.

- Use area and length models to multiply two fractions, with the denominators 2, 3, 4.

### Represent and interpret data.

NC.5.MD.2 Represent and interpret data.

- Collect data by asking a question that yields data that changes over time.
- Make and interpret a representation of data using a line graph.

• Determine whether a survey question will yield categorical or numerical data, or data that changes over time.

Clarification	Checking for Understanding
	Determine whether a survey question will yield categorical or numerical data, or data that
	changes over time.
	Determine whether each question will yield data for a bar graph, a line plot, or a line
	graph.
	<ul> <li>What is the length from your thumb to your wrist in inches?</li> </ul>
	<ul> <li>How does your heart rate change every 30 seconds for 4 minutes after doing 10 jumping jacks?</li> </ul>
	<ul> <li>Would you rather have ice cream, a brownie, or a popsicle for dessert?</li> </ul>
	Possible student response:
	The length question will give an answer that is a number so that can be shown on a line plot.
	The heart rate question collects data that changes over time so that can be shown on a
	line graph.
	graph.
	Example: Write 3 survey questions. Write one question that yields categorical data, one question that yields numerical data, and one question that yields data that changes over time. Label each question with both the type of data it will yield and the type of graph that should be used to share the data.
	Possible responses: Categorical data: On what day of the week (Monday-Friday) do you play with your friends after school the most? I would use a bar graph for this data because categories are being compared.
	Numerical Data: How many pets do you have in your house? I would use a line plot for this data because the answers will all be numbers.
	Changes over time: What is your heart rate every 10 seconds after jogging in place for a minute? I would use a line graph for this data because heart rate changes over time.

NC.5.MD.4 Recognize volume as an attribute of solid figures and measure volume by counting unit cubes, using cubic centimeter, cubic inches, cubic feet, and improvised units.

**Clarification** In this standard, students begin their exploration of volume by building and exploring right rectangular prisms with cubes. Right rectangular prisms are 3-dimensional shapes that all have rectangular faces and all angles are right angles. As students develop their understanding of volume they understand that a 1-unit by 1-unit cube is the standard unit for measuring volume. This cube has a length of 1 unit, a width of 1 unit and a height of 1 unit and is called a cubic unit.

The concept of volume should be extended from area with the idea that students are covering an area (the bottom of cube) with a layer of unit cubes and then adding layers of unit cubes on top of the bottom layer. Students should pack cubes (without gaps) to build right rectangular prisms and count the cubes to determine the volume or build right rectangular prisms from cubes and see the layers as they build.

### For example:

Students will pack cubes into a rectangular prism and continue layering the unit cubes until the prism is full. Then, students count the number of unit cubes to determine volume.

**Checking for Understanding** Find the volume of this figure.

### Possible response:

I can see that the top layer of the prism has 24 cubes. Since this is a rectangular prism, I know that each layer will have the same number of cubes. So, if I think about packing the prism with cubes, I would count 24 for each layer. I could build a model of this prism with cubes so I can count the number of cubes, or I can add 24 + 24 +24 + 24 + 24 + 24 + 24 + 24

While finding the volume of a rectangular prism, Cedrick filled the bottom of the box with unit cubes. How can that help him find the volume of the entire rectangular prism?

### Possible Responses:

### Student A:

I can count all of the cubes in the bottom layer. Then I can repeatedly add up that number in each layer to find the volume.

### Student B:

I know that volume can be found by looking at the area of the base or bottom layer of the rectangular prism. I can use the length and width and multiply them together to find the number of cubes in each layer. I then can add up that number for each layer to find the volume.

Return to Standards

NC.5.MD.5 Relate volume to the operations of multiplication and addition.

- Find the volume of a rectangular prism with whole-number side lengths by packing it with unit cubes and show that the volume is the same as would be found by multiplying the edge lengths.
- Build understanding of the volume formula for rectangular prisms with whole-number edge lengths in the context of solving problems.
- Find volume of solid figures with one-digit dimensions composed of two non-overlapping rectangular prisms.

Clarification	Checking for Understanding
	Temple and Katie were both building right rectangular prisms. Temple's prism had a length of 6, a width of 4, and a height of 3. Katie's prism had a base with an area that was half of Temple's, but the volume of her prism was larger than Temple's prism. If the height of Katie's prism is less than 10 units what could the possible dimensions be for Katie's prism?
	Possible Responses: Student A: Temple's prism has a volume of 6 x 4 x 3 which is 72 cubic units. The base of Temple's prism was 24 since 6 x 4= 24.
	Katie's prism has a base area that is half of Temple's which is $24 \div 2 = 12$ square units. Katie's height must give her prism a volume greater than 72 but is less than 10. Since the volume is the area of the base times the height that means that 12 x height = 72. The height has to be greater than 6 but less than 10.
	Student B: Katie's prism has a base area that is half of 24 which is 12 square units. Katie's length and width could be any numbers that multiply to equal 12 which could be 6 x 2, 4 x 3, or 12 x 1.
	Since Katie's prism is larger than Temple's, Katie's prism must have a height that gives her a volume of more than 72 cubic units. Katie's base is 12 square units so the height of Katie's prism must be greater than 6 but less than 10.

<b>Understand the coordinate plane.</b> <b>NC.5.G.1</b> Graph points in the first quadrant of a coordinate plane, and identify and interpret the x and y coordinates to solve problems.			
Clarification	Checking for Understanding		
In this standard, students are introduced to the coordinate plane and learn to plot points in the first quadrant in order to solve real-world and mathematical problems. Problems include traveling from one point to another and identifying the coordinates of missing points in geometric figures, such as squares, rectangles, and parallelograms. Students should understand that the coordinate plane is formed by a horizontal number line, called the x-axis, and a vertical number line, called the y-axis. The two axes intersect at a point called the origin (0,0). Students need to understand coordinates define a distance from the y-axis and a distance from the x-axis.	<ul> <li>Plot these points on a coordinate grid.</li> <li>Point A: (2,6); Point B: (4,6); Point C: (6,3); Point D: (2,3)</li> <li>Connect the points in order. Make sure to connect Point D back to Point A.</li> <li>1. What geometric figure is formed? What attributes did you use to identify it?</li> <li>2. What line segments in this figure are parallel?</li> <li>3. What line segments in this figure are perpendicular?</li> <li><i>Possible response:</i></li> <li><i>I made a trapezoid. The line segments that are parallel AB and DC. The perpendicular line segments are AD and DC.</i></li> </ul>		
Students should distinguish between two different ways of viewing the point (2, 3). First, they should view the coordinates as instructions: "right 2, up 3". They should also understand the coordinates as the point defined by being a distance 2 from the <i>y</i> -axis and a distance 3 from the <i>x</i> -axis.	Yasmin wants to make a parallelogram that does not have any right angles. She plots the following points: Point S: (0,0), Point U: (3, 3). If line segment TU is 2 units long, where can Points T and V be to make her shape? Possible Response: $\begin{array}{c} & & \\ & $		

### Classify quadrilaterals.

- NC.5.G.3 Classify quadrilaterals into categories based on their properties.
   Explain that attributes belonging to a category of quadrilaterals also belong to all subcategories of that category.
   Classify quadrilaterals in a hierarchy based on properties.

Clarification	Checking for Understanding
This standard calls for students to reason about the attributes (properties) of quadrilaterals in order to classify quadrilaterals into categories. Geometric attributes include properties of sides	Explain that attributes belonging to a category of quadrilaterals also belong to all subcategories of that category.
(parallel, perpendicular, equal length), properties of angles (type, measurement), and properties of symmetry. Students should	Questions that might be posed to students include:
understand that if a category contains certain attributes, then all quadrilaterals in that category have that attribute.	A parallelogram has 4 sides with both sets of opposite sides parallel. What types of quadrilaterals are parallelograms?
For example: If a parallelogram has four sides and opposite sides are parallel and equal, then all shapes that meet these	Possible responses: Rectangle, square, parallelogram
criteria are parallelograms including squares, rectangles, and rhombuses.	All rectangles have 4 right angles. Squares have 4 right angles so squares are always also rectangles. True or False? Explain why. Are rectangles always squares? Explain why.
The notion of congruence ("same size and same shape") may be part of classroom conversation but the concepts of congruence and similarity do <b>not</b> appear until middle school.	Possible Response: A square always is a parallelogram with 4 right angles so a square can always also be called a rectangle.
Note: North Carolina has adopted the exclusive definition for a trapezoid. A trapezoid is a quadrilateral with <i>exactly</i> one pair of parallel sides.	A rectangle is a parallelogram with 4 right angles and a square is a rectangle that has 4 sides that are the same length. Not all rectangles are squares. Therefore, a rectangle is sometimes, but not always, a square.
This standard also calls for students to classify quadrilaterals into a hierarchy based on the relationship between shapes based on	A trapezoid has 2 sides parallel, so it is always a parallelogram. True or False? Explain why.
attributes.	Possible Response: A trapezoid has exactly 1 pair of parallel sides and a parallelogram must have 2 pairs of parallel sides. A trapezoid can never be a parallelogram.
	Classify quadrilaterals in a hierarchy based on properties. Create a Hierarchy Diagram using the following terms: polygons – a closed plane figure formed from line segments that meet only at their endpoints. quadrilaterals - a four-sided polygon. rectangles - a quadrilateral with two pairs of equal, parallel sides and four right angles. rhombus – a parallelogram with all four sides equal in length. square – a parallelogram with four equal sides and four right
	angles.
